Figures and plates

Plates

(Plate 2) Micro-sections of some typical Arran rocks. Fig. 1. Permian sandstone, old quarries at Corrie. x12. Grains of quartz, felspar and quartzite, the surfaces of which have been rounded by wind abrasion ("millet seed" grains), are coated and cemented loosely by limonite. Fig. 2. Lower Carboniferous Sandstone, south side of String Road, 915m SW of Brodick Church. x13. Angular grains of quartz (dusty with fluid inclusions) and of decomposed felspar and siliceous rock are loosely cemented by clay. Fig. 3. Lower Old Red Sandstone, shore cliff, 800m S of Dougrie. x 11.5. Angular and unsorted grains of quartz (clear), decomposed felspar (grey) fragments of mudstone, igneous rocks and oxidized iron ore are compactly cemented by the fine-grained waste of similar material. Fig. 4. Pebbly grit, Dalradian, near SE end of Creag Ghlas Laggen, North Arran. x 10.5. Fig. 5. Cleaved grit, Dalradian, shore 69m ESE of Loch Ranza pier. x9–5. The rock has been sheared. Quartz and quartzite pebbles have been deformed and ground away until their long axes lie parallel to the schistosity which is strongly developed by parallel orientation of the chlorite and muscovite flakes of the matrix. Fig. 6. Slate, Dalradian, old quarries on hillside 2.4km E of head of Loch Ranza. x 13. The paler and darker bands represent more silty and more clayey alternations of the original strata. Within the paler bands the effect of shearing can be seen in the development of a lenticular schistosity on a microscopic scale. Fig. 7. Pitchstone dyke, Schoolhouse, Brodick. x12. Small euhedral crystals of quartz lie in a matrix of rock-glass from which numerous crystallites of pyroxene have grown. In other parts the rock contains euhedral prisms of zoned plagioclase and pyroxene which are not shown in this figure. (Figure 8). Granite, Glen Rosa. x12. The rock is composed of oligoclase (showing straight cleavage lines), orthoclase (turbid), quartz (clear, with tiny inclusions and cracks), and biotite (dark, with straight close cleavage). A small prism of zircon lies on the left side of the topmost biotite). Fig. 9. Olivine basalt lava, Lower Carboniferous, Corrie shore opposite schoolhouse. x10.5. Euhedral phenocrysts of purplish augite (bottom right) and olivine serpentinized along cracks (centre) lie in a matrix composed mainly of plagioclase laths, augite grains, and iron ore granules.

ERA	SYSTEMS AND SUB-DIVISIONS		CONDITIONS OF DEPOSITION	THICKNESS (in metres)	IGNEOUS ROCKS		AGE in m.y.
					CONTEMPORANEOUS	INTRUSIVE	
QUATERNARY	RECENT AND PLEISTOCENE	Blown sand : Peat Alluvium	Fluviatile				1.8
		Raised beach deposits	Marine				
		Moraines	Glacial				
		Boulder clay	Glacial				
TERTIARY	No sedimentary rocks				Lavas in Central Ring Complex	Granite, Central Ring Complex: Sills and dykes	65
MESOZOIC	CRETACEOUS / JURASSIC	Only as masses and fragments in the Tertiary Central Volcanic Ring Complex					195
	TRIASSIC	Marls and sandstones	Lacustrine: fluviatile	700			230
UPPER PALAEOZOIC	PERMIAN	Sandstones & breccias	Aeolian: torrential	200	lava (in conglomerate)		280
	CARBONIFEROUS	Coal Measures	Deltaic	293 (at Corrie)		quartz-dolerite dykes	345
		Passage Group (Millstone Grit)	Deltaic		Lavas locally		
		Carboniferous Limestone Series	Marine; estuarine		Lava, agglomerate	a few dykes	
		Calciferous Sandstone Series	Lagoonal				
	OLD RED SANDSTONE	Upper	Fluviatile	920	Lavas locally		395
		Lower	Lacustrine : fluviatile	1200	Lavas locally	a few sills	
LOWER PALAEOZOIC	SILURIAN	Not represented					
	ORDOVICIAN	Arenig	Marine	? 300	Lavas	Gabbro	500
	DALRADIAN (? Cambrian)	North Sannox schistose-grits, schists and slates		1800 +			

(Table 1) The geological systems and rock-formations of Arran.

GEOLOGICAL EVENTS		CLIMATIC PHASES	APPROXIMATE TIME-RANGE B.C.	POLLEN ZONES
Period of Maximum Glaciation	.....	.....	Ending at 23,000	
Lateglacial Period:[1]				
Confluent Glacier Stage		Arctic		
Valley Glacier Stage	High Lateglacial Raised Beach	to	23,000 to 9,000	I to III
Corrie Glacier Stage		Sub-Arctic		
Final Disappearance of the Ice	.....	.....	8,300	
Postglacial Period:				
		Pre-Boreal Phase	8,300 to 7,000	IV–V
Submerged Peat and Forest Bed	Main Postglacial Shoreline	Boreal Phase[2]	7,000 to 5,500	VI
		Atlantic Phase	5,500 to 3,000	VII
		Sub-Boreal Phase	3,000 to 1,000	VII
Present-day Conditions		Sub-Atlantic Phase	1,000 to 0	VIII

[1]During this period there were two re-advances of the glacier ice, their limits marked by prominent moraines: these are the Perth and Loch Lomond Re-advances. The latter took place after an interval between 14,000 and 11,000 years ago when ice disappeared from Arran only to be followed by a deterioration in climate again before the final retreat of the ice at about 8,300 years ago.

[2]Material from a bed of peat underlying the carse clays of the Main Postglacial Shoreline (25 foot Raised Beach) at Airth Colliery, southeast of Stirling has been assigned by carbon dating to 6,461±157 B.C. (Godwin 1961).
